

# Hardware choice

## Proposal Document

---

### Scenario 1: Manufacturing

#### Client Requirements and Potential Hardware Solution

Which hardware might be most appropriate for this scenario?
<b>FPGA - <a href="#">Intel® Arria® 10 GX1150 FPGA</a></b>

Requirement Observed	How does the chosen hardware meet this requirement?
<i>Industrial grade system that last for at least 5-10 years.</i>	FPGAs have a long lifespan and made to last long in industrial conditions, typically at least 10 years. The ambient operating temperature is in the range 5°C - 60°, which is suited for factory line needs.
<i>System should have ability to be repurposed for other issues.</i>	FPGAs are field-programmable, they can be re-programmed to adapt to new, evolving, and custom networks. They can also be optimised for different deep learning tasks.
<i>Image processing task of the system needs to be completed 5 times per seconds.</i>	FPGAs can excute neural networks with high performance and very little latency.

#### Queue Monitoring Requirements

Maximum number of people in the queue	5
Model precision chosen	FP16

## Test Results

***Model Load Time***

***Inference Time***

## Final Hardware Recommendation

### Final Hardware Recommendation

*Considering the requirements like flexibility, long term solution and elevate image processing capabilities, FPGA s are the best hardware for this scenario. This is also proved by the test result: FPGA performed better in terms on inferencing time and number of processed frames per second.*

## Scenario 2: Retail

### Client Requirements and Potential Hardware Solution

Which hardware might be most appropriate for this scenario?

**IGPU** - Integrated Graphic Processor Unit

Requirement Observed	How does the chosen hardware meet this requirement?
<i>No budget for additional hardware.</i>	As the IGPU is already present in the checkout computers there won't be need for additional hardware.
Save on power consumption	<i>An Intel i7 has a typical TDP of 95W. Moreover, unused sections in a GPU can be powered down to reduce power consumption.</i>
<i>Need of an Edge AI System</i>	Using an integrated GPU, the system does not need to be have an Internet connection, and the model loading and inference can all be done in the edge itself.

## Queue Monitoring Requirements

Maximum number of people in the queue	2
Model precision chosen	FP16

## Test Results

## Final Hardware Recommendation

### Final Hardware Recommendation

*The use of an integrated graphic unit address the problems of space and budget. Moreover, as shown by the test results, an integrated GPU has a good inference time which would not impact the normal operations of the checkout computers.*

## Scenario 3: Transportation

### Client Requirements and Potential Hardware Solution

#### Which hardware might be most appropriate for this scenario?

**VPU - [Intel® Neural Compute Stick 2](#)**

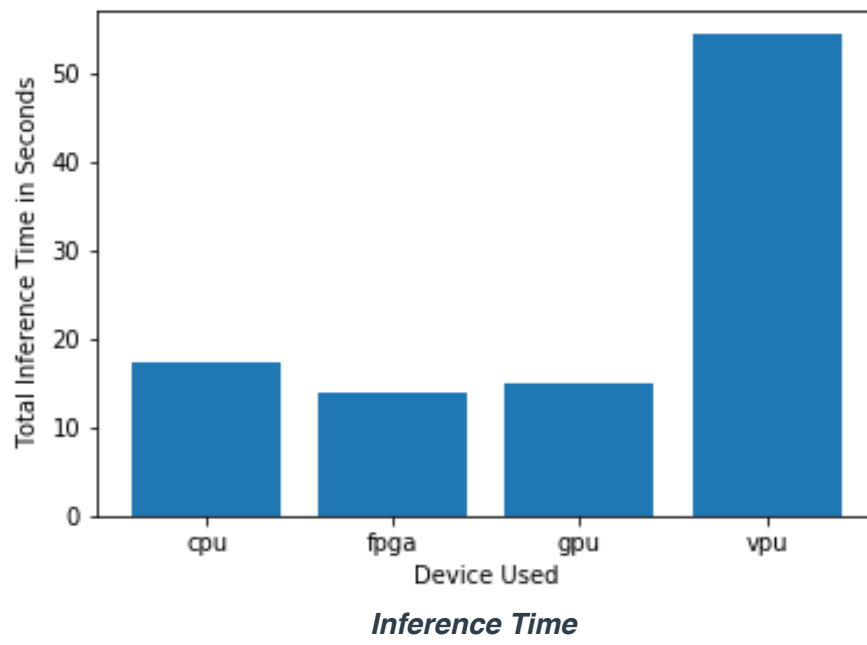

Requirement Observed (Include at least two.)	How does the chosen hardware meet this requirement?
<i>Maximum budget of \$300 per machine.</i>	NCS2 cost only less than \$100
<i>Current machines have no additional processing power available.</i>	NCS2 requires only a USB3 port. The inference load can be done exclusively on the NCS2 without additional CPU load.
<i>Save on power requirements</i>	NCS2 have a power consumption of only 1W
<i>System need to process stream from 7 CCTV cameras</i>	NCS2 can excite 4 trillion of operations per seconds and support multiple video stream per device.

## Queue Monitoring Requirements

Maximum number of people in the queue	7
Model precision chosen	FP16

## Test Results

## Final Hardware Recommendation

### Final Hardware Recommendation

*The test results show that an FPGA device would be a better choice. However, taking into account the budget and saving power requirements, a NCS2 is a more suitable choice.*
